SUVANKAR MITRA

BACKEND ENGINEER | JAVA · LINUX · SQL · DEVOPS

Bengaluru, India • suvankarmitra.for.work@gmail.com • linkedin.com/in/suvankar-mitra • github.com/suvankar-mitra

PROFESSIONAL SUMMARY

Backend-focused Technology Lead with 10+ years of experience building and supporting mission-critical financial systems. Deep expertise in transaction settlement, temporal data snapshotting, data lifecycle management, database performance, legacy modernization, and production automation. Technical owner for critical snapshotting, archival/reactivation, global-purge, and integer-ID lifecycle workflows. Hands-on across Java, Shell, SQL, C, Perl, Linux/RHEL, Sybase ASE, GitLab CI/CD, and Terraform.

CORE ENGINEERING STRENGTHS

Backend Engineering • Financial Transaction Systems • Temporal Data & Versioning • Data Lifecycle Management • Distributed Batch Processing • Idempotent & Resumable Workflows • Database Performance • Legacy Modernization • Linux/RHEL • CI/CD & Infrastructure as Code • Production Reliability • Incident/RCA • Technical Leadership

PROFESSIONAL EXPERIENCE

Technology Lead | Infosys — Client: Goldman Sachs

Bengaluru, India | June 2015 – September 2026

- Served as SME and technical owner for the data-snapshotting domain within the core transaction-settlement portion of the Global Order Settlement System (GLOSS), supporting Private Wealth Management.
- Owned a two-dimensional temporal snapshotting architecture that tracked settlement and account state across business-date validity and intraday snapshot-timestamp windows, supporting current-date and as-of processing.
- Designed and maintained snapshot versioning/milestoning: updates within an active snapshot window modified the current state, while subsequent windows closed prior versions and opened new ones without losing historical state.
- Built and evolved transaction-data archival and reactivation capabilities to control active database growth across related tables, restoring archived data when subsequent settlement activity required it.
- Designed and maintained global purge workflows across active and archived stores, applying policy-driven inclusion/exclusion rules and coordinating deletion of related transaction data across distributed tables.
- Owned a critical integer-ID lifecycle platform used by transaction, settlement, and event-processing workflows, including purge and reclamation components to safely recycle finite ID capacity.
- Designed distributed ID-purge workflows with batch workers, idempotent execution, durable progress tracking, and crash recovery/resumability; designed reclamation workflows to find free ranges, calculate global intersections, and validate ranges before reuse.
- Led modernization of 100+ legacy trading services from Sun Solaris/RHEL 4/5 to RHEL 7/8 and dynamic cloud-based Linux environments using Infrastructure as Code principles.
- Developed and optimized services and operational tooling using Java, Shell, SQL, and C; delivered stored-procedure enhancements and database optimizations for trading operations.
- Automated manual operational workflows, reducing operational support incidents by 35%, and designed and deployed GitLab CI/CD pipelines for multiple applications.
- Mentored and coordinated onshore/offshore teams of 5 engineers; drove end-to-end delivery, production incident resolution, root-cause analysis, and stakeholder communication.

SELECTED PROJECTS

Free Dictionary API | *Java · Spring Boot · PostgreSQL · Redis · Docker*

- Built and deployed a public dictionary API backed by a large lexical dataset, with API documentation and a self-hosted deployment; the service is under active development.

Links: API documentation • Source code

API Portal | *Developer Documentation · Open Source*

- Developed a central portal for discovering and accessing documentation for publicly available APIs.

Links: Live portal • Source code

TECHNICAL SKILLS

Languages: Java, Shell Script, C, Perl, T-SQL
Databases: Sybase ASE, SQL, Stored Procedures, Data Lifecycle Management
DevOps & CI/CD: GitLab CI/CD, Terraform, Git, SVN, CVS
Infrastructure: Linux, RHEL 4–8, Infrastructure as Code (IaC), Dynamic Cloud Hosts
Engineering: Backend Development, Transaction Processing, Temporal Data, Distributed Batch Processing, Archival/Purge, Performance Optimization
Reliability & Delivery: Idempotency, Resumability/Recovery, Incident Management, Root Cause Analysis, SLA Management, Jira, ServiceNow, SDLC, Technical Leadership

EDUCATION

Master of Computer Application (MCA) | Heritage Institute of Technology, Kolkata | 2012–2015 | GPA: 9.15
B.Sc. (Hons.) in Mathematics | Barasat Government College, Kolkata | 2009–2012 | 73.75%

PUBLICATION

A Location-based Mobility Prediction Scheme for Post-Disaster Communication Network using DTN | IEEE, 2015 | IEEE Xplore

LANGUAGES

English (Fluent) • Hindi (Fluent) • Bengali (Native)
